Please use the file - YourOwnTokenizer.ipynb to write your code and report.

In this assignment, you are asked to create your own word tokenizer without the help of external tokenizers.

Steps to the assignment:

1. Choose one of the corpora from nltk.corpus list given - assign it to corpus_name
2. Create your tokenizer in the code block - tokenize the selected corpus into token_list
3. Give the raw corpus text, corpus_raw, and the my_token_list to the evaluation block

Only splitting on whitespace is not enough. At least try two other improvements on the tokenization. Please write sufficient comments to show your reasoning.

Rules

Allowed:

- Choosing a top-down tokenizer or bottom-up tokenizer
- Using regular expressions library (import re)
- Adding additional coding blocks
- Having an additional dataset if you are creating a bottom-up tokenizer but you need to be able to run the code standalone.

Not allowed:

- Using tokenizer libraries such as nltk.tokenize, or any other external libraries to tokenize.
- Changing the contents of the evaluation block at the end of the notebook.

Assignment Report

Please write a short assignment report at the end of the notebook (max 500 words). Please include all of the following points in the report:

- Corpus name and the selection reason
- Design of the tokenizer and reasoning
- Challenges you have faced while writing the tokenizer and challenges with the specific corpus
- Limitations of your approach
- Possible improvements to the system

Grading

You will be graded with the following criteria:

- running complete code (0.5),
- tokenizer algorithm (2),
- clear commenting (0.5),
- evaluation score - comparison with nltk word tokenizer (at most 1 point),

- assignment report (1).

Submission

Submission will be made to SUCourse. Please submit your file using the following naming convention.

studentid_studentname_tokenizer.ipynb - ex. 26744_aysegulrana_tokenizer.ipynb

Deadline is October 22nd, 5pm.
